1. Introduction to MATLAB	3
1.1. What is MATLAB and why do we use it?	3
1.1.1. MATLAB's desktop	3
1.1.2. Help – how we search for information?.....	5
1.1.3. Ending a MATLAB session.....	6
1.1.4. INPUT and OUTPUT data.....	6
1.1.5. Arithmetical operations in MATLAB.....	8
1.1.6. Predefined mathematical functions in MATLAB.....	9
1.1.7. Number format in MATLAB.....	9
1.2. Applications	11
2. Variables.....	12
2.1. Declaring variables.....	12
2.2. Predefined variables and constants	14
2.3. Variable control functions	15
2.3.1. Variable identification	15
2.3.2. Deleting variables	15
2.4. Writing commands	15
2.5. Assignment and re-assignment.....	16
2.6. Matrix-type variables	17
2.6.1. VECTOR – 1-dimension Matrix.....	17
2.6.2. MATRIX.....	17
2.7. The structure of a MATLAB program	18
2.7.1. Creating and saving an M-file.....	18
2.7.2. Saving the workspace in a .mat file	19
2.7.3. How to RUN an M-file	20
2.8. Applications	21
3. Vectors and Matrices	23
3.1. Vectors and matrices - Overview	23

3.2.	Vectors	24
3.2.1.	Creating vectors	24
3.2.2.	Creating linear vectors	24
3.2.3.	Operations with vectors	26
3.3.	Matrices	28
3.3.1.	Creating special matrices	29
3.3.2.	Index, identifying and changing the elements of a matrix.....	31
3.3.3.	Matrix manipulation.....	33
3.3.4.	Vector and matrix data processing.....	36
3.4.	Arithmetical operations	37
3.4.1.	Scalar operations	38
3.4.2.	Array operations.....	38
3.4.3.	Matrix operations	39
3.5.	Applications	40
4.	Algorithms Implementation Using MATLAB Scripts	42
4.1.	Programming MATLAB Scripts	42
4.2.	MATLAB Scripts.....	43
4.3.	Dynamic user variable assignment in MATLAB Scripts.....	47
4.4.	Displaying the results of a script	48
4.5.	Live scripts in MATLAB	48
4.5.1.	Text formatting in Live Scripts.....	49
4.5.2.	Adding images in Live Scripts.....	51
4.5.3.	Adding equations to Live Scripts.....	52
4.5.4.	Writing the code in Live Script.....	52
4.6.	Applications	54
5.	Conditional statements	57
5.1.	The IF Statement	57
5.2.	Conditional and relational operators	58
5.3.	If...else Statement	59
5.4.	The ELSEIF Clause.....	61
5.5.	The SWITCH Statement	62
5.6.	The MENU Statement.....	63
5.7.	Common pitfalls.....	63

5.8. Applications	64
6. Loop statements.....	66
6.1. FOR loop statement.....	66
6.2. While loop statement.....	69
6.3. Applications	72
7. Functions	73
7.1. Function definition in MATLAB scripts.....	73
7.2. Returning more than one value from a MATLAB function.....	76
7.3. Variables: local, persistent and global.....	76
7.4. Applications	79
8. Plots - visual representation in MATLAB.....	82
8.1. Creating 2D plots in MATLAB	82
8.1.1. Using polar coordinates [2].....	84
8.2. Parametric graphics in MATLAB	85
8.2.1. Visual representations with parametric axes.....	85
8.2.2. Visual representation with one parametric axis	86
8.3. Creating 3D plots in MATLAB	87
8.3.1. Creating a helix spiral	87
8.3.2. Creating mesh and surface plots	87
8.4. Creating multiple plots on the same graph.....	90
8.5. Applications	91
9. Working with external files in MATLAB	93
9.1. Reading data from a file in MATLAB	93
9.2. Writing data into a MATLAB file.....	98
9.3. Rules to working with files in MATLAB	101
9.4. Applications	103
10. References	105

1. Introduction to MATLAB

1.1. What is MATLAB and why do we use it?

MATLAB is an easy-to-use platform through which one can both learn programming and use it for solving simple or complex problems.

During this class we will cover the basic elements of MATLAB, those that are related to operating, programming techniques and combining these two to solve problems from mathematics, physics, thermodynamics, electricity, etc.

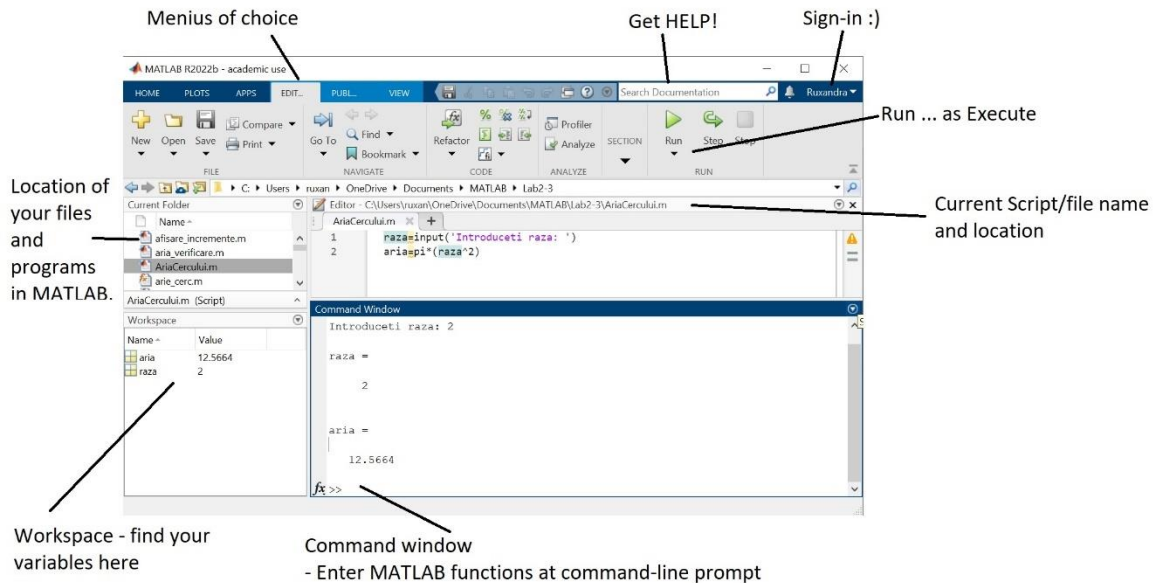

The main purpose of the application sessions is to get students familiar with the software in order to solve problems. The accent falls on learn-by-doing experiences where the student learns while working on a computer and solving problems in MATLAB.

The name MATLAB comes from MATrix LABoratory – an advanced programming language which allows technical calculus. It is more than a programming language, it is a modern programming environment which incorporates complex data structures, instruments that allow editing and debugging programs, support object-oriented programming etc. It is a package that include calculus, visualization and programming.

The main unit or element in MATLAB, as the name says, is the matrix. Hence it integrates matrix or array calculus, signal processing, system identification, statistics, experimental data processing. It works with toolboxes from different domains and areas. It has predefined routines and functions that allow various computations, thus making it a valuable instrument for the academic and industrial environment.

1.1.1. MATLAB's desktop

When MATLAB software is running, in the program's window the main area is represented by the Command Window.

The main elements of MATLAB window are:

- **Command Window** – The main window – one can enter variables, evaluate expressions, run commands or programs.
- **Help Window** – It shows MATLAB’s help.
- **Workspace Window** – Shows information and data about the variables used.
- **Current Directory Window** – Shows the files in the current folder.
- **Editor Window** – Used to edit and debug/correct MATLAB programs - scripts and/or functions.
- **Command History Window** – Shows the history of commands introduced in the Command Window.
- **Figure Window** - It opens automatically when a graphical command is executed and it shows their result in a visual display.

Command Window is the main window in MATLAB through which the user interacts dynamically with the program. In this window the symbol named prompt “>>” is always visible. Commands and expressions are introduced after the prompt, and MATLAB will immediately show the result or an error message, if this is the case.

Example:

If we type in:

```
>> help sin
```

Matlab will return information about the **sin ()** function.

sin Sine of argument in radians.

sin(X) is the sine of the elements of X.

To remember!

Frequently used commands:

↑ (up arrow) – repeats the last command;

clc – clears all the commands in the Command Window

whos – shows a list with all declared variables

clear – deletes the declared variables

help – explains any existing function

doc – show a documentation page in the Help Browser

The **Command History** window displays the commands which have been typed, not only on the current session (in the present Command Window), but also the commands previously introduced. Use “*Shift*” to select more lines at once.

The **Current Folder** window displays the files from the current folder. These can be grouped or sorted in many ways, for example grouped by type and sorted by name. If one file is selected, then all the information available is shown in the lower part.

The **Workspace** window shows the variables initialized in the current session and their value.

Exercise:

Type the following in the Command Window:

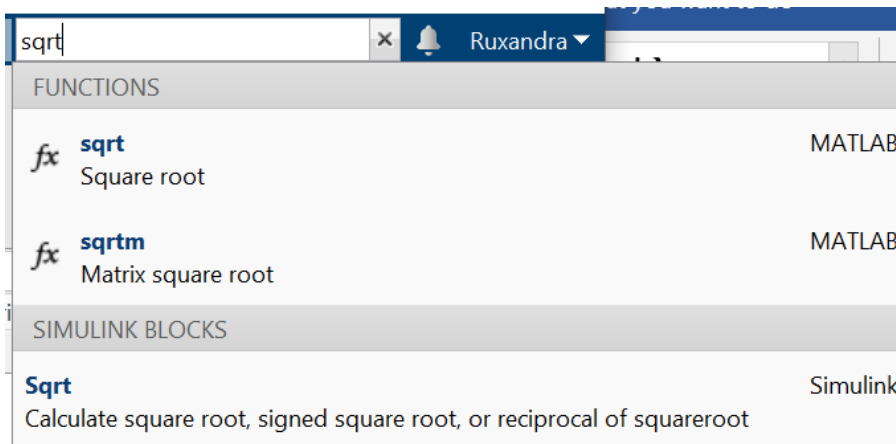

1+1 then press Enter

Sqrt(pi) then press Enter

Sin(10) then press Enter

1.1.2. Help – how we search for information?

Remember that MATLAB uses common names for common functions. In the Help Window is enough to type the first few letters of the command and MATLAB will display of possible functions related to those letters.

Another way, for example, is to type `>> help sqrt` in the Command Window. Here it is what MATLAB will show:

```
Command Window
help sqrt

sqrt Square root.
sqrt(X) is the square root of the elements of X. Complex
results are produced if X is not positive.

See also sqrtn, realsqrt, hypot.

Documentation for sqrt

fx >> |
```

Both approaches produce the same result – information about the desired function.

1.1.3. Ending a MATLAB session

The easiest way to exit MATLAB is to type at the prompt `>>exit` or `quit`.

ATTENTION!!! Before exiting MATLAB, make sure you have saved your variables, printed/saved your plots and diagrams, saved the files you need or you cleaned up the app before closing.

1.1.4. INPUT and OUTPUT data

MATLAB gets the input data and commands through the Command Window and returns the results in two ways: text or numerical results displayed also in the Command Window and diagrams/graphics in a separate window.

Input data – define and initialize a variable with a value.

Commands – operations applied to variables in order to obtain the desired result.

Output data – Results display – numerical or graphical.

Example:

```
Command Window
>> 1/2+3/5

ans =

    1.1000

fx >> |
```

Exercise:

a=1 Enter

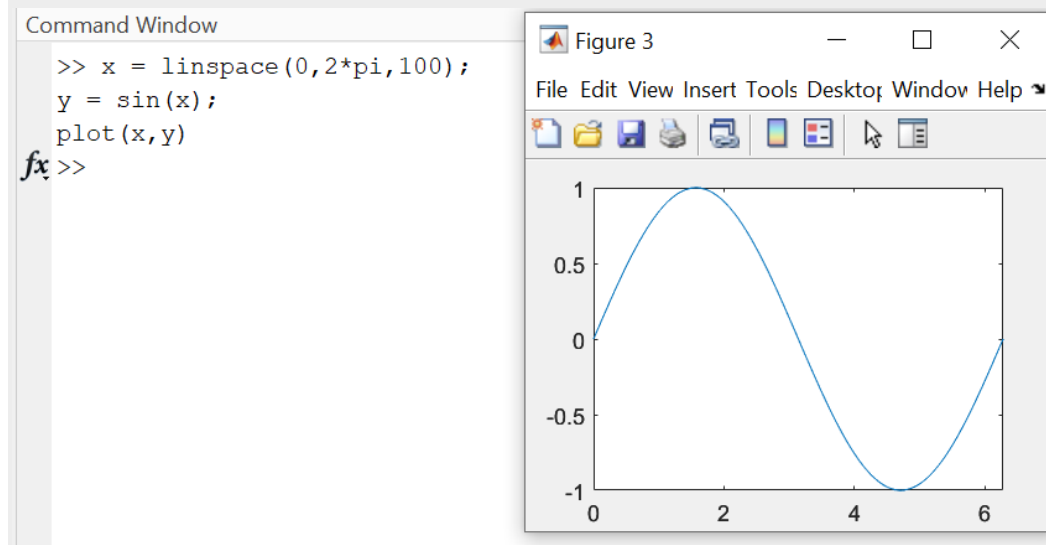

b=2 Enter

a+b Enter

c=(a-4)+b^5 Enter

Example:

Create a 2D diagram using the *plot* function to display the sine function from 0 to 2π .

1.1.5. Arithmetical operations in MATLAB

Number representation in MATLAB:

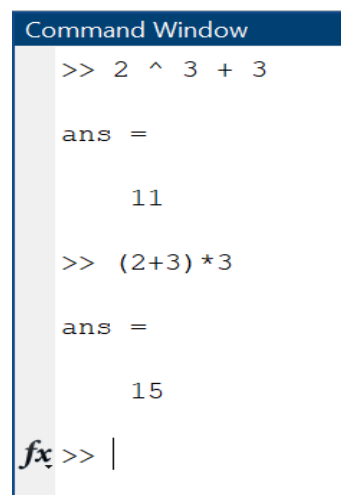

5	-88	0.0003
7.9875934	1.50310E-20	5.03445e23

The numbers used in MATLAB are in the range of 10^{-308} to 10^{308} .

For the arithmetical expressions, MATLAB uses the following symbols:

+	addition
-	subtraction
*	multiplication
/	right division ($a/b = a/b$)
\	left division ($a\b = b/a$)
^	exponential (for example 5^2 gives 25)

Division has two symbols which are especially used for array operations. For scalar expressions the result is the same using each symbol. For example $1/4$ and $4\backslash 1$ give the same result 0.25.

```
Command Window
>> 2 ^ 3 + 3
ans =
    11
>> (2+3) *3
ans =
    15
fx >> |
```

Precedence of Arithmetic Operator

Some arithmetic operators have a different priority from others. For example, in the following expression $2^3 + 3$, the power-up has priority versus the addition. The use of parenthesis can change the operation order in an expression.
